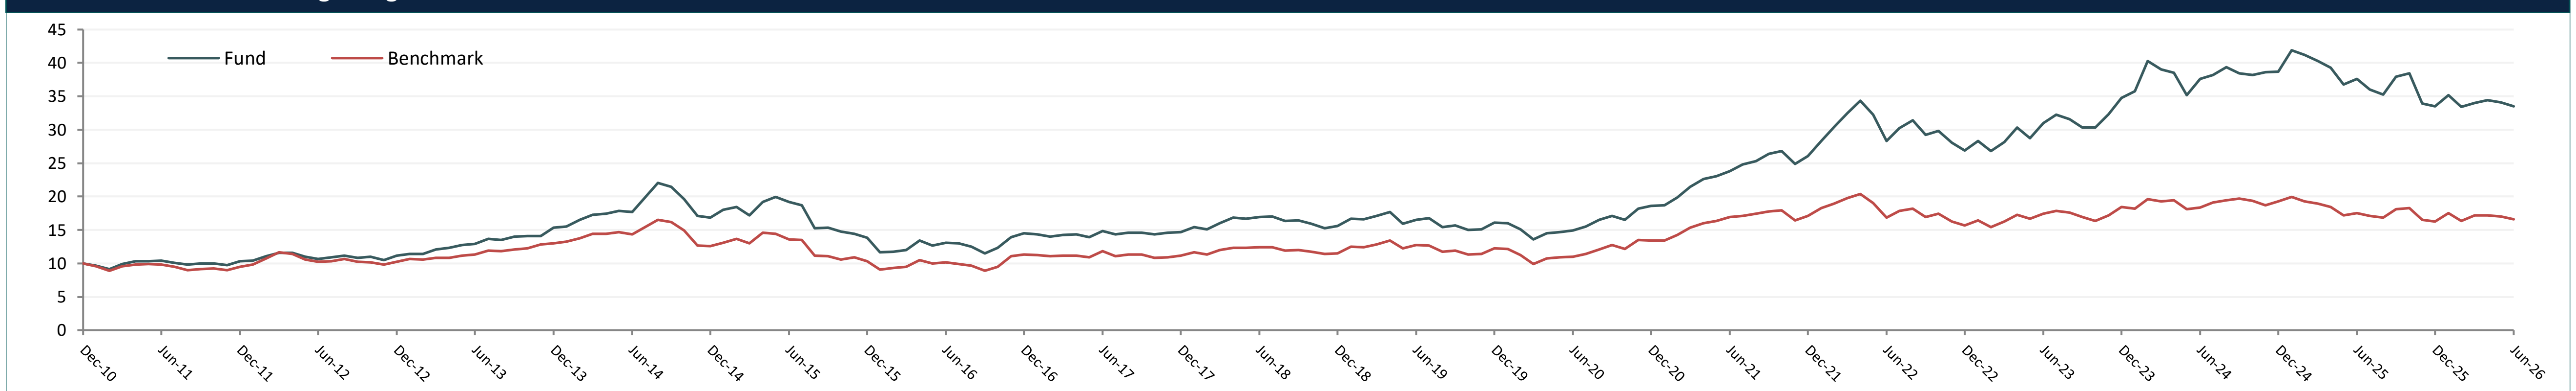
N/A	N/A	N/A

Fund Performance since beginning



Description of formulas utilized for assessing performance and risk measures

Standard Deviation:	Standard deviation is a statistical measure that shows how much the values in a data set spread out or deviate from the mean (average) of the data. The standard deviation equals the square root of the sum of the squared differences between each value and the mean, divided by the number of values minus one
Sharpe Indicator:	The Sharpe ratio measures how much excess return you earn for each unit of risk you take. In words, the formula is: Sharpe Ratio = (Average return of the investment − Risk-free rate) ÷ Standard deviation of the investment's returns
Tracking Error:	Tracking Error measures how closely a portfolio follows the benchmark it is supposed to track. It shows the volatility of the difference between the portfolio's returns and the benchmark's returns. Essentially, it tells you how much the portfolio's performance deviates from the benchmark. The most common formula for tracking error is the standard deviation of the difference between the portfolio returns and the benchmark returns
Beta	Beta (β) is a measure of a mutual fund's sensitivity to market movements. It shows how much the fund's returns tend to move in response to changes in the overall market (typically represented by a benchmark index). Beta equals the covariance between the mutual fund's returns and the market's returns, divided by the variance of the market's returns.
Alpha:	Alpha is a measure of a mutual fund's performance relative to a benchmark index, adjusted for the risk taken. It indicates the value a fund manager adds or subtracts from a fund's return compared to the expected return based on the fund's risk. Alpha = Actual return of the fund - (Risk-free rate + Beta of the fund × (Market return - Risk-free rate))
